

Exp 12.

DATE:-

AIM:-

To implement echo client server using TCP/UDP sockets.

ALGORITHM:-

Server.py:-

- Create a UDP socket
- Bind the socket to specific IP address (127.0.0.1) & port (12345)
- Continuously listen for incoming message
- When message received - decode it
- Display message along with sender address
- Repeat infinitely

Client.py

- Create UDP socket
- Set a timeout for socket to avoid waiting
- Send a predefined message hello to server IP address & port 12345.
- If no response received in timeout period, print timeout message.
- Close socket.

CODE

Server.py

```
import socket
```

```
def start_server(host='127.0.0.1', port=12345):
```

```
    with socket.socket(socket.AF_INET, socket.SOCK_STREAM) as s:
```

```
        s.bind((host, port))
```

```
        print(f"UDP server running on {host}:{port}")
```

```
    while True:
```

```
        data, addr = s.recvfrom(1024)
```

```
        print(f"received message from {addr}: {data.decode()}")
```

```
if __name__ == "__main__":
```

```
    start_server()
```

Client.py

```
def ping_server(host='127.0.0.1', port=12345):
```

```
    with socket.socket(socket.AF_INET, socket.SOCK_DGRAM) as s:
```

```
        s.sendto(b'Hello', (host, port))
```

```
    try:
```

```
        s.sendto(b'Hello', (host, port))
```

```
        print("message done to the server")
```

```
    except socket.timeout:
```

```
        print("request timed out")
```

```
if __name__ == "__main__":
```

```
    ping_server()
```

OUTPUT

Server.py

```
> python server.py
```

```
>> UDP server running on 127.0.0.1:12345
```

Client.py

```
> python client.py
```

```
>>
```

message sent to server

Server terminal:

Received message from (127.0.0.1, 56003): Hello

RESULT:-

Thus the program of echo client server using UDP socket has been implemented & executed successfully.
